VEGETABLES - FRESH MARKET

ANNUAL SUMMARY

1961

Production of the 27 principal fresh market vegetables and melons in 1961 was 4 percent less than the record 1960 crop but 4 percent above average, the Crop Reporting Board announced today. The production of 212.8 million hundredweight compares with 220.7 million hundredweight in 1960 and the average annual production of 203.8 million. Contributing most to the decline from 1960 was the smaller production for onions, carrots, watermelons, and lettuce. Of these, onions, carrots, and lettuce produced record tonnages in 1960. Five vegetables--artichokes, sweet corn, cucumbers, green peppers, and tomatoes--set new records in production this year. Total production of the 24 principal vegetables for fresh market at 169.7 million hundredweight was 3 percent below the record 1960 output. Value of the principal vegetable and melon crops totaled \$824,200,000, 2 percent above last year and 7 percent above average. Tomatoes and lettuce--the two crops with over 100 million dollars value--account for 34 percent of the total.

Strawberry production in 1961 at 512.6 million pounds, was 10 percent more than last year and 11 percent above average. Of the total 1961 production, 57 percent was used for fresh market and 43 percent went to processors. This was the highest percentage for fresh use since 1951. Volume moving to fresh channels was the largest since the early 1940's.

Estimates for the years 1954-59 have been revised using information from the 1959 Census of Agriculture and other available data. These revised estimates were published in Statistical Bulletin No. 300. Averages and estimates for 1960 and 1961 published in this Summary are on the revised level and continue the series published in Statistical Bulletin No. 300. In this summary as well as in Statistical Bulletin No. 300 estimates for cauliflower are on a close trim or "pre-package" basis. Estimates were previously carried on the basis of head trimmed slightly for packing in a pony crate. The trend in recent years has been toward a close trim pack. For this reason, estimates have been placed on this basis. Production and price estimates prior to 1954 may be converted to a comparable basis by using the factors shown in Statistical Bulletin No. 300.

For the first time this report carries statistics on the 10 major crops grown in Hawaii and the 3 major vegetables grown in Alaska. These estimates are shown at the end of the commodity tables and are included in the crop and State summary tables. Since vegetables in these two States are not divided into seasons, estimates are not included in the seasonal crop summary.

Some changes from last year occurred in the rank of the five leading vegetable producing States. California continues to be the leader with nearly a fourth of the United States vegetable and melon acreage and nearly a third of the production. Acreagewise, Florida replaced Texas in second place and Arizona moved ahead of New York to take over fourth place. In production, Arizona traded with New York, putting Arizona in fourth and New York in fifth place. No change occurred in the rank of States according to value of production. The five leading States account for 61 percent of the harvested acreage, 68 percent of the Nation's production and 72 percent of the value of vegetables and melons produced.

LEADING FRESH MARKET VEGETABLE STATES IN 1961

Rank	Harvested Acreage		Production		Value	
	State	Percent of total	State	Percent of total	State	Percent of total
1	California	23.2	California	32.1	California	36.7
2	Florida	14.4	Florida	14.7	Florida	16.7
3	Texas	14.0	Texas	9.5	Arizona	7.1
4	Arizona	4.8	Arizona	6.5	Texas	7.1
5	New York	4.7	New York	5.5	New York	4.3

Estimates in this publication relate primarily to fresh market production. While estimates for many vegetable crops include only fresh market production, those for a few crops, such as broccoli, cauliflower, and carrots, include substantial quantities processed. For asparagus and strawberries, which are perennial crops providing production for both fresh market and processing outlets from the same acreage, a utilization breakdown is given in addition to total production. "Acreage for harvest" in this summary embraces total acreage available for harvest, including mature acreage abandoned or only partially harvested because of low prices or other economic factors. Planted acreage in this report includes in addition to acreage for harvest, acreage lost or abandoned due to natural causes and acreage abandoned prior to reaching maturity because of economic conditions. Acreage lost and replanted to the same crop early enough to be harvested in the season for which it was originally intended, is counted only once. Acreage lost and replanted to the same crop for harvest in a later season, is considered to have been planted in both seasonal classifications but is included as acreage for harvest in the second season only. Acreage lost and replanted to another vegetable crop is included as planted acreage in estimates for both crops but as acreage for harvest for the second crop only. Both planted and for harvest acreage published for asparagus and strawberries includes only bearing acreage and excludes non-bearing acreage planted for harvest in a future marketing season. "Value" is for the marketing season or crop year and does not correspond to calendar year income. Group and all states averages are simple averages of annual data.

This summary provides fresh market estimates for the 27 principal vegetables and melons grown commercially in the more important producing States. These estimates provide basic statistics on over 80 percent of the national output of all vegetables and melons grown for fresh market sale. It has not been possible to include all vegetables in all States in this program. These data are based upon information secured by State Agricultural Statisticians from growers, shippers, processors, public agencies, and other sources. Estimates of mint for oil are also included in this report.
